Answer: B, D

QUESTION: 142

In an organization all customer information is stored in an Active Directory (AD). Special applications for customer contracts and transactions are all connected to this AD. This organization wants to enable customers to see their information online. Therefore, a web environment has been deployed including WebSphere Application Server, IBM Tivoli Directory Server (ITDS) and IBM Security Access Manager. For security reasons the organization decided that this web environment cannot directly connect to Active Directory but should use its own directory, ITDS. A letter will be sent to each customer with its personal login details. What is the least labor intensive way to authenticate a customer online?

- A. Switch on Microsoft's AD-LDAP replicate service
- B. Configure the ITDS authorization forwarding to AD
- C. Schedule an export of AD into LDIF and load this into ITDS.
- D. Use IBM Tivoli Directory Integrator to exchange essential data between the directories

Answer: D

QUESTION: 143

If an application is reachable under <https://www.example.com/insuranceApp/index.html>, what should be used if the server name changes to <https://www.example1.com/>?

- A. Use a regular junction.
- B. Use a SPNEGO junction.
- C. Use a virtual host junction.
- D. Use a transparent path junction.

Answer: D
