---

## Question: 1

---

You use a Microsoft SQL Server database that contains a table. The table has records of web requests as shown in the exhibit. (Click the Exhibit button.)

HttpRequest	
	HttpRequestId
	RequestDateTime
	ClientIP
	ClientUsername
	ServerIP
	ServerPort
	HttpMethodId
	UriStem
	UriQuery
	ServerStatus
	ServerSubstatus
	ServerWin32Status
	BytesSent
	BytesReceived
	TimeTaken
	ClientVersion
	ClientHost
	ClientUserAgentId
	ClientId
	SessionId
	TimeSpent

Your network has three web servers that have the following IP addresses:

- 10.0.0.1
- 10.0.0.2
- 10.0.0.3

You need to create a query that displays the following information:

- The number of requests for each web page (UriStem) grouped by the web server (ServerIP) that served the request
- A column for each server

Which Transact-SQL query should you use?

A

```
SELECT
    UriStem,
    [10.0.0.1],
    [10.0.0.2],
    [10.0.0.3],
FROM
    (SELECT HttpRequestId, ServerIP, UriStem FROM HttpRequest) r
PIVOT (
    COUNT (r.HttpRequestId)
    FOR r.ServerIP IN ([10.0.0.1], [10.0.0.2], [10.0.0.3])
) AS pvt
ORDER BY
    pvt.UriStem
```

B

```
SELECT
    UriStem,
    SUM(CASE WHEN ServerIP = '10.0.0.1' THEN 1 ELSE 0 END) AS
    [10.0.0.1],
    SUM(CASE WHEN ServerIP = '10.0.0.2' THEN 1 ELSE 0 END) AS
    [10.0.0.2],
    SUM(CASE WHEN ServerIP = '10.0.0.3' THEN 1 ELSE 0 END) AS
    [10.0.0.3],
FROM
    HttpRequest
GROUP BY
    UriStem
ORDER BY
    UriStem
```

C

```
SELECT
  UriStem,
  Server,
  Requests
FROM
  (SELECT HttpRequestId, ServerIP, UriStem FROM HttpRequest) r
UNPIVOT (
  Requests FOR Server IN ([ServerIP])
) AS pvt
ORDER BY
  Pvt.UriStem
```

D

```
DECLARE @Results TABLE (
  UriStem VARCHAR(255),
  [10.0.0.1] INT,
  [10.0.0.2] INT,
  [10.0.0.3] INT)

INSERT INTO @Results (UriStem, [10.0.0.1])
SELECT UriStem COUNT(HttpRequestId)
FROM HttpRequest
WHERE ServerIP = '10.0.0.1'

UPDATE @Results
SET [10.0.0.2] = COUNT(HttpRequestId)
FROM HttpRequest h INNER JOIN @Results r ON h.UriStem =
r.UriStem
WHERE ServerIP = '10.0.0.2'
```

```
UPDATE @Results
SET [10.0.0.3] = COUNT(HttpRequestId)
FROM HttpRequest h INNER JOIN @Results r ON h.UriStem =
r.UriStem
WHERE ServerIP = '10.0.0.3'

SELECT
    UriStem,
    [10.0.0.1] ,
    [10.0.0.2] ,
    [10.0.0.3]
FROM
@Results
```

- A. Option A
- B. Option B
- C. Option C
- D. Option D

---

**Answer: A**

---

Explanation:

PIVOT rotates a table-valued expression by turning the unique values from one column in the expression into multiple columns in the output, and performs aggregations where they are required on any remaining column values that are wanted in the final output.

References: <https://docs.microsoft.com/en-us/sql/t-sql/queries/from-using-pivot-and-unpivot?view=sql-server-2017>

---

## Question: 2

---

DRAG DROP

You develop a Microsoft SQL Server database for a sales ordering application.

You want to create a report that displays the increase of order quantities over the previous year for each product.

You need to write a query that displays:

Product name,

Year of sales order,

Sales order quantity, and

Increase of order quantity over the previous year.

Which three Transact-SQL segments should you use to develop the solution? To answer, move the appropriate Transact-SQL segments from the list of Transact-SQL segments to the answer area and arrange them in the correct order.

Statements

```
FROM Sales.SalesOrderHeader SOH
INNER JOIN Sales.SalesOrderDetail SOD ON
SOH.SalesOrderID = SOD.SalesOrderID
INNER JOIN Production.Product PRO ON
SOD.ProductID = PRO.ProductID
```

```
GROUP BY PRO.Name, OrderDate
```

```
GROUP BY PRO.Name, YEAR(OrderDate)
```

```
SELECT Pro.Name, YEAR(OrderDate), SUM
(SOD.OrderQty), SUM(SOD.OrderQty) -
LEAD(SUM(SOD.OrderQty), 1, 0)
OVER (PARTITION BY PRO.Name ORDER BY YEAR
(OrderDate) DESC)
```

```
SELECT Pro.Name, YEAR(OrderDate), SUM
(SOD.OrderQty), SUM(SOD.OrderQty) -
LAG(SUM(SOD.OrderQty), 1, 0)
OVER (PARTITION BY PRO.Name ORDER BY YEAR
(OrderDate) DESC)
```

Answer Area

(

---

**Answer:**

---

CertKillers.net

## Answer Area

```
FROM Sales.SalesOrderHeader SOH
INNER JOIN Sales.SalesOrderDetail SOD ON
SOH.SalesOrderID = SOD.SalesOrderID
INNER JOIN Production.Product PRO ON
SOD.ProductID = PRO.ProductID
```

```
SELECT Pro.Name, YEAR(OrderDate), SUM
(SOD.OrderQty), SUM(SOD.OrderQty) -
LAG(SUM(SOD.OrderQty), 1, 0)
OVER (PARTITION BY PRO.Name ORDER BY YEAR
(OrderDate) DESC)
```

```
GROUP BY PRO.Name, YEAR(OrderDate)
```

Explanation:

Box 1: FROM ..

Box 2: LAG (not LEAD)

Lag accesses data from a previous row in the same result set without the use of a self-join starting with SQL Server 2012 (11.x). LAG provides access to a row at a given physical offset that comes before the current row. Use this analytic function in a SELECT statement to compare values in the current row with values in a previous row.

Not lead: Lead accesses data from a subsequent row in the same result set without the use of a self-join starting with SQL Server 2012 (11.x). LEAD provides access to a row at a given physical offset that follows the current row.

Box 3: GROY BY PRO.NAME, YEAR (OrderDate)

References: <https://docs.microsoft.com/en-us/sql/t-sql/functions/lag-transact-sql?view=sql-server-2017>

---

### Question: 3

You develop a Microsoft SQL Server database that contains a table named Employee, defined as follows:

```
CREATE TABLE [dbo].[Employee]
(
  [EmployeeID] int PRIMARY KEY
  [Firstname] varchar(50) NOT NULL,
  [LastName] varchar(50) NOT NULL,
  [DepartmentID] int NOT NULL,
  [HireDate] date NOT NULL
)
```

You need to create a view that contains two computed columns representing the month and the year of the [HireDate] of each Employee.

Which function should you use?

- A. DATENAME( )
- B. CONVERT( )
- C. TRYDATEDIFF( )
- D. MONTH( ) and YEAR( )

---

**Answer: D**

---

Explanation:

The Month function returns an integer that represents the month of the specified date.

The Year function an integer that represents the year of the specified date.

References:

<https://docs.microsoft.com/en-us/sql/t-sql/functions/month-transact-sql?view=sql-server-2017>

<https://docs.microsoft.com/en-us/sql/t-sql/functions/year-transact-sql?view=sql-server-2017>

---

#### Question: 4

---

You administer a Microsoft SQL Server database named ContosoDb. The database has the following schema collection:

```
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
targetNamespace="http://tempuri.org/po.xsd"
xmlns="http://tempuri.org/po.xsd"
elementFormDefault="qualified">
<xs:element name="purchaseOrder" type="PurchaseOrderType"/>
<xs:complexType name="PurchaseOrderType">
<xs:sequence>
<xs:element name="items" type="Items"/>
</xs:sequence>
<xs:attribute name="orderDate" type="xs:date"/>
<xs:attribute name="requiresApproval" type="xs:boolean"/>
</xs:complexType>
<xs:complexType name="Items">
<xs:sequence>
<xs:element name="item" minOccurs="0" maxOccurs="unbounded">
<xs:complexType>
<xs:sequence>
<xs:element name="productName" type="xs:string"/>
<xs:element name="quantity" type="xs:positiveInteger"/>
</xs:sequence>
</xs:complexType>
</xs:element>
</xs:sequence>
</xs:complexType>
</xs:schema>
```

The database has a table named ReceivedPurchaseOrders that includes an XML column named PurchaseOrder by using the above schema.

You need to set the requiresApproval attribute of the XML documents to false if they contain more than 50 items.

Which Transact-SQL query should you run?

**A**

```
UPDATE ReceivedPurchaseOrders SET PurchaseOrder.modify(`
  declare namespace MI="http://tempuri.org/po.xsd";
  replace value of (/MI:purchaseOrder/MI:requiresApproval)
  with (
    if (count(/MI:purchaseOrder/MI:items/MI:item)>50) then
      xs:boolean("true")
    else
      xs:boolean("false")
  )`);
```

**B**

```
UPDATE ReceivedPurchaseOrders SET PurchaseOrder.modify(`
  declare namespace MI="http://tempuri.org/po.xsd";
  replace value of (/MI:purchaseOrder/MI:requiresApproval)
  with (
    if (count(/MI:purchaseOrder/MI:items)>50) then
      xs:boolean("true")
    else
      xs:boolean("false")
  )`);
```

C

```
UPDATE ReceivedPurchaseOrders SET PurchaseOrder.modify(`
  declare namespace MI="http://tempuri.org/po.xsd";
  replace value of (/MI:purchaseOrder/@requiresApproval)[1]
  with (
    if (count(/MI:purchaseOrder/MI:items/MI:item)>50) then
      xs:boolean("true")
    else
      xs:boolean("false")
  )`);
```

D

```
UPDATE ReceivedPurchaseOrders SET PurchaseOrder.modify(`
  declare namespace MI="http://tempuri.org/po.xsd";
  replace value of (/MI:purchaseOrder/@requiresApproval)[1]
  with (
    if (count(/MI:purchaseOrder/MI:items)>50) then
      xs:boolean("true")
    else
      xs:boolean("false")
  )`);
```

- A. Option A
- B. Option B
- C. Option C
- D. Option D

---

**Answer: D**

---

Explanation:

Replace value of (XML DML) updates the value of a node in the document.

Example: -- update text in the first manufacturing step

```
SET @myDoc.modify(`
```

```
replace value of (/Root/Location/step[1]/text())[1]
```

```
with "new text describing the manu step"
```

```
`);
```

---

**Question: 5**

---

DRAG DROP

Your Microsoft SQL Server database contains tables as shown below.

You have tables that were created by running the following Transact-SQL statements:

```
CREATE TABLE dbo.Category
(
CategoryID INT NOT NULL IDENTITY(1,1) CONSTRAINT PK_Category
PRIMARY KEY CLUSTERED
, CategoryName VARCHAR(200) NOT NULL
, ProductDescription VARCHAR(1000) NULL
, IsActive BIT DEFAULT (1)
)
GO
```

```
CREATE TABLE dbo.Product
(
ProductID INT NOT NULL IDENTITY(1,1) CONSTRAINT PK_Product
PRIMARY KEY CLUSTERED
, ProductName VARCHAR(200) NOT NULL
, CategoryID INT NOT NULL
, ProductDescription VARCHAR(1000) NULL
, ListPrice MONEY NOT NULL
, Quantity INT NOT NULL
, CONSTRAINT FK_Product_Category FOREIGN KEY (CategoryID)
REFERENCES Category(CategoryID)
)
GO
```

The Product table contains 10,000 records. The maximum ProductID is 11,000.

There are 12 rows in the Category table. The maximum CategoryID is 12.

The Product table contains at least one product in every category.

Data in the tables was accidentally modified. To correct this, you need to make some updates directly to the tables. You issue several statements.

Which result or results will you obtain for each Transact-SQL statement? To answer, drag the appropriate results to the correct Transact-SQL statements. Each result may be used once. More than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

**SQL Statements**

**Answer area**

The statement succeeds.

The statement fails because the syntax is incorrect.

The statement fails because the primary key constraint in the Product table is violated.

The statement fails because the value for an identity column cannot be explicitly specified during an insert

The statement fails because the foreign key constraint is violated.

The statement fails because an identity column value cannot be changed during an update statement.

The statement fails because the data type is incorrect for one of the fields.

```
SET IDENTITY_INSERT dbo.Product ON;INSERT
dbo.Product (ProductID, ProductName, categoryID,
ProductDescription, ListPrice, Quantity) VALUES
(20000, 'Strawberry Yogurt', 9, '', 0.98*6, 57);SET
IDENTITY_INSERT dbo.Product OFF;
```

```
DELETE dbo.Category WHERE CategoryID = 11
```

```
INSERT dbo.Product (ProductName, CategoryID,
ListPrice, Quantity) VALUES ('Chocolate Cake', 25,
5, 100);
```

```
UPDATE dbo.Category SET IsActive='-1' WHERE
CategoryID = 5
```

Result

Result

Result

Result

**Answer:**

**Statement**

```
SET IDENTITY_INSERT dbo.Product ON;INSERT
dbo.Product (ProductID, ProductName, CategoryID,
ProductDescription, ListPrice, Quantity) VALUES
(20000, 'Strawberry Yogurt', 9, '', 0.98*6, 57);SET
IDENTITY_INSERT dbo.Product OFF;
```

```
DELETE dbo.Category WHERE CategoryID = 11;
```

```
INSERT dbo.Product ( ProductName, CategoryID,
ListPrice, Quantity) VALUES ('Chocolate Cake', 25, 5,
100);
```

```
UPDATE dbo.Category SET IsActive = '-1' WHERE
CategoryID = 5;
```

The statement succeeds.

The statement fails because the foreign key constraint is violated.

The statement fails because the value for an identity column cannot be explicitly specified during an insert.

The statement fails because the data type is incorrect for one of the fields.

Explanation:

Box 1:

The SET IDENTITY\_INSERT command allows explicit values to be inserted into the identity column of a table.

Box 2:

The Product table contains at least one product in every category.

Box 3:

Box 4:

Bit is a data type that can take a value of 1, 0, or NULL.

References:

<https://docs.microsoft.com/en-us/sql/t-sql/data-types/bit-transact-sql?view=sql-server-2017>

<https://docs.microsoft.com/en-us/sql/t-sql/statements/set-identity-insert-transact-sql?view=sql-server-2017>

### Question: 6

DRAG DROP

You develop an application that uses data from a Microsoft SQL Server database.

Your application experiences blocking problems.

You need to enable row versioning and you want connections to have row versioning enabled by default.

How should you complete the Transact-SQL statement? To answer, drag the appropriate command to the correct positions. Each command may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

Command	Transact-SQL Statement
SET ALLOW_SNAPSHOT_ISOLATION ON	ALTER DATABASE MyDatabase
SET CHANGE_TRACKING = ON	
SET READ_COMMITTED_SNAPSHOT ON	CREATE PROCEDURE MyProcedure AS SET NOCOUNT ON
SET ROW_VERSIONING ON	Command
SET TRANSACTION ISOLATION LEVEL READ COMMITTED	
SET TRANSACTION ISOLATION LEVEL REPEATABLE READ	
SET TRANSACTION ISOLATION LEVEL SNAPSHOT	

**Answer:**

**Transact-SQL Statement****ALTER DATABASE MyDatabase****SET READ\_COMMITTED\_SNAPSHOT ON****CREATE PROCEDURE MyProcedure  
AS  
SET NOCOUNT ON****SET ALLOW\_SNAPSHOT\_ISOLATION ON**

Explanation:

You can use a row versioning-based isolation level.

Set READ\_COMMITTED\_SNAPSHOT database option ON to enable read-committed transactions to use row versioning, and use snapshot isolation.

References: <https://docs.microsoft.com/en-us/sql/relational-databases/sql-server-transaction-locking-and-row-versioning-guide?view=sql-server-2017>

---

**Question: 7**

---

DRAG DROP

You are a developer for a Microsoft SQL Server database. You need to write a stored procedure that performs several operations in the most efficient way possible.

Which operator or operators should you use? To answer, drag the appropriate operators to the correct operations. Each operator may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

Operators		Operation
UNION ALL	Combine two unrelated result sets and return all records, including duplicates.	Operator
MERGE	Combine two result sets and return all distinct records with matching values.	Operator
ANY	Join two result sets and return all related records, including duplicates.	Operator
EXCEPT	Compare records from two related result sets. If there are differences, insert new records and update existing ones.	Operator
FULL OUTER JOIN	Join two related result sets and return all records from both.	Operator
INNER JOIN		
INTERSECT		

---

**Answer:**

---

	Operation
Combine two unrelated result sets and return all records, including duplicates.	UNION ALL
Combine two result sets and return all distinct records with matching values.	INTERSECT
Join two result sets and return all related records, including duplicates.	INNER JOIN
Compare records from two related result sets. If there are differences, insert new records and update existing ones.	MERGE
Join two related result sets and return all records from both.	FULL OUTER JOIN

Explanation:

Box 1: UNION ALL

UNION combines the results of two or more queries into a single result set that includes all the rows that belong to all queries in the union.

UNION ALL Incorporates all rows into the results. This includes duplicates. If ALL is not specified, duplicate rows are removed.

Box 2: INTERSECT

INTERSECT returns distinct rows that are output by both the left and right input queries operator.

Box 3: INNER JOIN

The INNER JOIN keyword selects records that have matching values in both tables.

Box 4: MERGE

Merge performs insert, update, or delete operations on a target table based on the results of a join with a source table. For example, you can synchronize two tables by inserting, updating, or deleting rows in one table based on differences found in the other table.

Box 5: FULL OUTER JOIN

The FULL OUTER JOIN keyword return all records when there is a match in either left (table1) or right (table2) table records.

Note: FULL OUTER JOIN can potentially return very large result-sets!

---

**Question: 8**

You develop a database application for Microsoft SQL Server and Microsoft Azure SQL Database.

You need to raise an exception and transfer execution to a CATCH block.

You need to ensure that the exception returns output in the following format:

Msg 51000, Level 16, State 1, Line 1

The record does not exist.

Which Transact-SQL statement should you run?

A

```
DECLARE @Message NVARCHAR(2048);
SELECT @Message = FORMATMESSAGE('The record does not exist. ');
THROW 51000
, 1
, @Message
```

B

```
THROW 51000
, 'The record does not exist.'
, 1
```

C

```
THROW ERROR_MESSAGE
('The record does not exist. '), 1
```

D

```
THROW 51000
, FORMATMESSAGE('The record does not exist.')
, 1
```

A. Option A

B. Option B

C. Option C

D. Option D

---

**Answer: B**

---

Explanation:

The following example shows how to use the THROW statement to raise an exception.

```
THROW 51000, 'The record does not exist.', 1;
```

Here is the result set.

Msg 51000, Level 16, State 1, Line 1

The record does not exist.

References: <https://docs.microsoft.com/en-us/sql/t-sql/language-elements/throw-transact-sql?view=sql-server-2017>

**Question: 9**

DRAG DROP

You develop a database application for Microsoft SQL Server 2012 and Microsoft Azure SQL Database. You create a table named Purchasing.vVendorWithAddresses as shown in the following table.

	BusinessEntityID	Name	Address	City	StateProvinceName	PostalCode
1	1492	Australia Bike Retailer	28 San Marino Ct.	Bellingham	Washington	98225
2	1494	Allenson Cycles	4659 Montoya	Altadena	California	91001
3	1496	Advanced Bicycles	7995 Edwards Ave.	Lynnwood	Washington	98036
4	1498	Trikes, Inc.	90 Sunny Ave	Berkley	California	94704
5	1500	Morgan Bike Accessories	9098 Story Lane	Albany	New York	12210
6	1502	Cycling Master	4823 Stonewood Ct.	Walla Walla	Washington	99362
7	1504	Chicago Rent-All	15 Pear Dr.	Newport Beach	California	92625
8	1506	Greenwood Athletic Company	6441 Co Road	Lemon Grove	Arizona	85252
9	1508	Compete Enterprises, Inc.	50 Via Del Sol	Lynnwood	Washington	98036
10	1510	International	683 Larch Ct.	Salt Lake City	Utah	84101

You write the following Transact-SQL (Line numbers are included for reference only.)

```
01 CREATE PROCEDURE
```

```
02 usp_GetVendorNeighbors
```

```
03 @vendorname nvarchar(50)
```

```
04 AS
```

```
05 SELECT name FROM
```

```
06 Purchasing.vVendorWithAddresses t
```

```
07 WHERE
```

```
08 . . .
```

You need to add Transact-SQL statements at line 08 to ensure that GetVendorInStateNeighbors

returns the names of vendors that are located in all states where the vendor specified in the @vendorname parameter has a location.

Which three Transact-SQL segments should you use to develop the solution? To answer, move the appropriate Transact-SQL segments from the list of Transact-SQL segments to the answer area and arrange them in the correct order.

Statements	Answer Area
StateProvince IN (	
(	
SELECT StateProvince FROM Purchasing VendorWithAddresses	
WHERE Name = @vendorname )	
EXISTS (	
v.Name = @vendorname	
AND 1 = 1 }	
SELECT Name FROM Purchasing VendorWithAddresses WHERE s.name = @vendorname	

---

**Answer:**

---

## Answer Area

```
StateProvince IN (
```

```
SELECT StateProvince FROM  
Purchasing.VendorWithAddresses
```

```
WHERE Name = @vendorname  
)
```

Explanation:

The IN statement determines whether a specified value matches any value in a subquery or a list.

Incorrect:

The EXISTS command specifies a subquery to test for the existence of rows.

References: <https://docs.microsoft.com/en-us/sql/t-sql/language-elements/in-transact-sql?view=sql-server-2017>

---

### Question: 10

---

A local bank uses a SQL Server database to manage accounts. You are developing a stored procedure that contains multiple Transact-SQL INSERT statements.

The stored procedure must use transaction management to handle errors.

You need to ensure that the stored procedure rolls back the entire transaction if a run-time occurs.

Which Transact-SQL statement should you add to the stored procedure?

- A. SET ARITHABORT ON
- B. SET NOEXEC ON
- C. SET TRANSACTION ISOLATION LEVEL ON
- D. SET XACT\_ABORT ON

---

**Answer: D**

---

Explanation:

SET XACT\_ABORT specifies whether SQL Server automatically rolls back the current transaction when a Transact-SQL statement raises a run-time error.

When SET XACT\_ABORT is ON, if a Transact-SQL statement raises a run-time error, the entire transaction is terminated and rolled back.

References: <https://docs.microsoft.com/en-us/sql/t-sql/statements/set-xact-abort-transact-sql?view=sql-server-2017>
