Version: 4.0

Question: 1

What are some best practices for writing SQLScript for use with calculation views? Note. There are 2 correct answers to this question.

- A. Break up large statements by using variables.
- B. Choose declarative language instead of imperative language.
- C. Control the flow logic using IF-THEN-ELSE conditions.
- D. Use dynamic SQL.

Answer: A,B

Question: 2

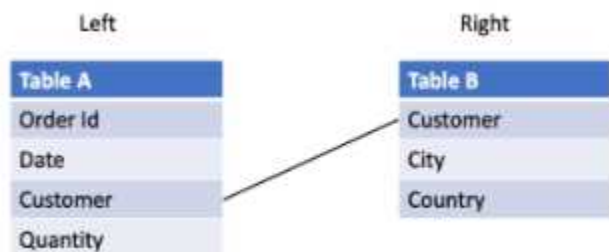

Why would you create SQL in calculation views?

- A. To implement custom logic
- B. To provide an alternative to graphical modelling
- C. To enable write capabilities
- D. To fine-tune performance

Answer: A

Question: 3

You implement a referential join between Table A and Table B, but when you query the calculation view, Table B is not pruned. What could be the problem? Note. There are 2 correct answers to this question.

- A. Join cardinality is set .1.

- B. The Country column is requested.
- C. Integrity constraint is set to RIGHT.
- D. The Keep flag is activated for the Customer column.

Answer: C,D

Question: 4

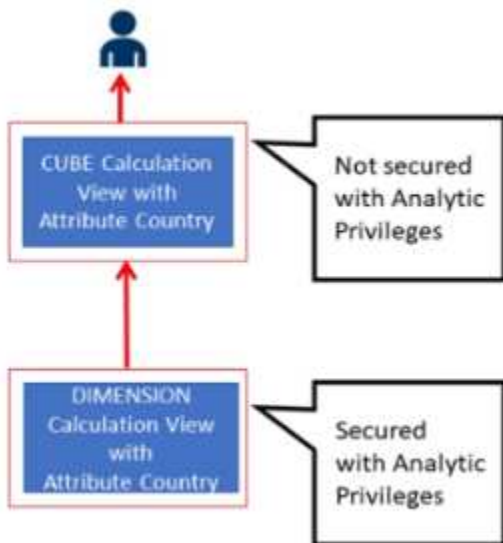

You want to ensure that your calculation view does not give unexpected results for a query that is based on any combination of columns. What is the recommended approach for

- A. Write and execute a custom SQL query in the SQL Console.
- B. Select and deselect columns from the output mapping.
- C. Set the HIDE property for columns NOT required.
- D. Select Data Preview for the calculation view.

Answer: A

Question: 5

When modeling in the SAP Web IDE for SAP HANA, which object do you build to provide access to tables in external schemas?

- A. Virtual Table
- B. Synonym
- C. Association
- D. Alias

Answer: B

Question: 6

Using the table in the diagram, you need to create a cube calculation view. What is the simplest approach to create the output from the screenshot?

Year	Value
2014	100
2014	200
2015	100
2015	100
2015	200
2015	100
2016	200

2014	2015	2016
300	500	200

- A. Create 3 calculated columns.
- B. Create a restricted column for each country.
- C. Implement a union node and map each year as a separate column.
- D. Create a filter expression that uses an OR operator.

Answer: C

Question: 7

Why do you use parameter mapping in a calculation view? Note. There are 2 correct answers to this question.

- A. To convert the data types of input parameters
- B. To assign variables to one or more attributes
- C. To push down filters to the lowest level calculation views
- D. To pass variable values to external value help views

Answer: C ,D

Question: 8

Why should you define calculated column expressions using plain SQL and avoid using column engine language?

- A. To prevent queries from unfolding
- B. To access the full set of SQL functions
- C. To allow imperative statements
- D. To benefit from additional SQL optimizations

Answer: D

Question: 9

A calculation view includes a rank node that uses the source data and settings shown in the graphic. Your query requests all columns of the rank node. How many rows are in the output of your query?

Data Source for Rank Node:

COUNTRY	DIVISION	COMPANY	AMOUNT
US	X	A	10
US	X	B	12
US	X	C	13
US	P	D	16
US	P	E	14
US	P	F	18
DE	X	B	5
DE	X	C	19
DE	X	D	13
CA	X	A	20
CA	X	B	21
CA	X	D	4
CA	P	E	2

Rank Node Settings:

Aggregation Function: **Row**
Result Set Direction: **Top**
Result Set Type: **Absolute**
Target Value: **Fixed (2)**
Offset: **Fixed (0)**

Partition Columns: **COUNTRY
DIVISION**

- A. 6
- B. 2
- C. 9
- D. 5

Answer: C

Question: 10

You set the Null Handling property for an attribute but do not set a default value. What is displayed when null values are found in a column of data type NVARCHAR?

- A. "?"
- B. "Null"
- C. "0"
- D. <empty string>

Answer: D
